

## ABSTRACT

Systems and techniques for submitting requests for approval relating to management of real property include presenting, on a user interface, a form for receiving data from a first user. An indication of one or more requests to be approved is received as a result of a user interaction with the form. For each request, types of data items to be provided by the first user are identified. The types of data items identified for each service are based on a type associated with the request. An indication of the identified types of data items for each request is displayed on the form. After a submission of the form, an approval of at least one, but fewer than all, of the requests can be received from a second user. In response, the first user can be notified of the approval and of requests not approved.
